

- Natural join
 - Equi join
 - Outer joins: Outer join have three types. They are:
 - Left outer join
 - Right outer join
 - Full outer join
-

41) What is 1NF?

1NF is the First Normal Form. It is the simplest type of normalization that you can implement in a database. The primary objectives of 1NF are to:

- Every column must have atomic (single value)
 - To Remove duplicate columns from the same table
 - Create separate tables for each group of related data and identify each row with a unique column
-

42) What is 2NF?

2NF is the Second Normal Form. A table is said to be 2NF if it follows the following conditions:

- The table is in 1NF, i.e., firstly it is necessary that the table should follow the rules of 1NF.
 - Every non-prime attribute is fully functionally dependent on the primary key, i.e., every non-key attribute should be dependent on the primary key in such a way that if any key element is deleted, then even the non_key element will still be saved in the database.
-

43) What is 3NF?
