

Hybrid

- A hybrid topology is a combination of different topologies to form a resulting topology.
 - If star topology is connected with another star topology, then it remains star topology. If star topology is connected with different topology, then it becomes a Hybrid topology.
 - It provides flexibility as it can be implemented in a different network environment.
 - The weakness of a topology is ignored, and only strength will be taken into consideration.
-

3) What are the advantages of Distributed Processing?

A list of advantages of distributed processing:

- Secure
 - Support Encapsulation
 - Distributed database
 - Faster Problem solving
 - Security through redundancy
 - Collaborative Processing
-

4) What is the criteria to check the network reliability?

Network reliability: Network reliability means the ability of the network to carry out the desired operation through a network such as communication through a network.

Network reliability plays a significant role in the network functionality. The network monitoring systems and devices are the essential requirements for making the network reliable. The network monitoring system identifies the problems that are occurred in the network while the network devices ensure that data should reach the appropriate destination.

The reliability of a network can be measured by the following factors:
