

It does not occupy space in the memory.

It occupies space in the memory.

It is a data type that represents the blueprint of an object.

It is an instance of the class.

It is declared once.

Multiple objects can be declared as and when required.

It uses the keyword class when declared.

It uses the new keyword to create an object.

A class can exist without any object.

Objects cannot exist without a class.

---

## 12) What are the key differences between class and structure?

Class is a group of common objects that shares common properties.

The structure is a collection of different data types.

It deals with data members and member functions.

It deals with data members only.

It supports inheritance.

It does not support inheritance.

Member variables cannot be initialized directly.

Member variables can be initialized directly.
