

It is of type reference.

It is of a type value.

It's members are private by default.

It's members are public by default.

The keyword class defines a class.

The keyword struct defines a structure.

An instance of a class is an object.

An instance of a structure is a structure variable.

Useful while dealing with the complex data structure.

Useful while dealing with the small data structure.

13) What is the concept of access specifiers when should we use these?

In OOPs language, access specifiers are reserved keyword that is used to set the accessibility of the classes, methods and other members of the class. It is also known as access modifiers. It includes public, private, and protected. There is some other access specifier that is language-specific. Such as Java has another access specifier default. These access specifiers play a vital role in achieving one of the major functions of OOP, i.e. encapsulation. The following table depicts the accessibility.
