

- It is designed to make sure that a computer system performs well by managing its computational activities.
 - It provides an environment for the development and execution of programs.
-

3) What are the different operating systems?

- Batched operating systems
 - Distributed operating systems
 - Timesharing operating systems
 - Multi-programmed operating systems
 - Real-time operating systems
-

4) What is a socket?

A socket is used to make connection between two applications. Endpoints of the connection are called socket.

5) What is a real-time system?

Real-time system is used in the case when rigid-time requirements have been placed on the operation of a processor. It contains a well defined and fixed time constraints.

6) What is kernel?

Kernel is the core and most important part of a computer operating system which provides basic services for all parts of the OS.

7) What is monolithic kernel?
