
8) What makes a network effective and efficient?

There are mainly two criteria which make a network effective and efficient:

- Performance: : performance can be measured in many ways like transmit time and response time.
- Reliability: reliability is measured by frequency of failure.
- Robustness: robustness specifies the quality or condition of being strong and in good condition.
- Security: It specifies how to protect data from unauthorized access and viruses.

9) What is bandwidth?

Every signal has a limit of upper range frequency and lower range frequency. The range of limit of network between its upper and lower frequency is called bandwidth.

10) What is a node and link?

A network is a connection setup of two or more computers directly connected by some physical mediums like optical fiber or coaxial cable. This physical medium of connection is known as a link, and the computers that it is connected are known as nodes.

11) What is a gateway? Is there any difference between a gateway and router?

A node that is connected to two or more networks is commonly known as a gateway. It is also known as a router. It is used to forward messages from one network to another. Both the gateway and router regulate the traffic in the network.
