

Overriding

If a method with the same method signature is presented in both child and parent class is known as method overriding. The methods must have the same number of parameters and the same type of parameter. It overrides the value of the parent class method. It is also known as runtime polymorphism. For example, consider the following program.

```
class Dog
{
    public void bark()
    {
        System.out.println("woof ");
    }
}
class Hound extends Dog
{
    public void sniff()
    {
        System.out.println("sniff ");
    }
}
```
