

```
main(6);  
}  
}
```

40) Consider the following scenario:

If a class Demo has a static block and a main() method. A print statement is presented in both. The question is which one will first execute, static block or the main() method, and why?

JVM first executes the static block on a priority basis. It means JVM first goes to static block even before it looks for the main() method in the program. After that main() method will be executed.

```
class Demo  
{  
  static          //static block  
  {  
    System.out.println("Static block");  
  }  
  public static void main(String args[]) //static method  
  {  
    System.out.println("Static method");  
  }  
}
```
